

RADIOGRAPHIC CABINETS

The use of radiographic cabinets becomes necessary when a bunker is not existing or it's not possible to build. Those cabinets are manufactured using a special sandwich of metal sheets and special lead bricks which don't allow the leakage of radiations.

We follow the full needs of the customers concerning the design, dimensions, handling, automations and whatever is necessary to achieve a perfect NDT performance.

X-Ray systems can be installed from 160Kv up to 600Kv integrated with manipulators for standard radiography, CR or DR radiography.

The cabinets are then delivered key in the hands at customer site, with the necessary on site training and a reliable post-sales service.

Contact us for your needs, we will find the right solution!
