The world's only sunglasses with
retinal protection index
RETINAL INDEX®

FONDA SUNGLASSES

An exclusive collection of sunglasses that combines sophisticated design, high quality materials and advanced optical performance.

FONDA lenses, certified with the Retinal Index®, a parameter identified in collaboration with the CNR (National Institute of Optics), are the only ones that offer guaranteed protection from potential retinal damage in any situation.

Polarisation and anti-reflective treatments eliminate glare and improve visual contrast.

The collection includes six different models, both in acetate and metal, and available in three different colours. The acetate frames have accentuated thicknesses and sculpted profiles, while the metal frames feature a distinctive double bridge. The colour details are handmade.

Retinal Index®

Retinal Index® is a scientific parameter that measures the ability of a lens to protect the retina from the potentially harmful effects of solar radiation.

More precisely, it is a numerical indication of a lens' capability of minimizing the risk of retinal damage caused by exposure to UV, UVB and blue light.

A higher Retinal Index® value indicates greater protection, underlining the lens' ability to preserve visual health.

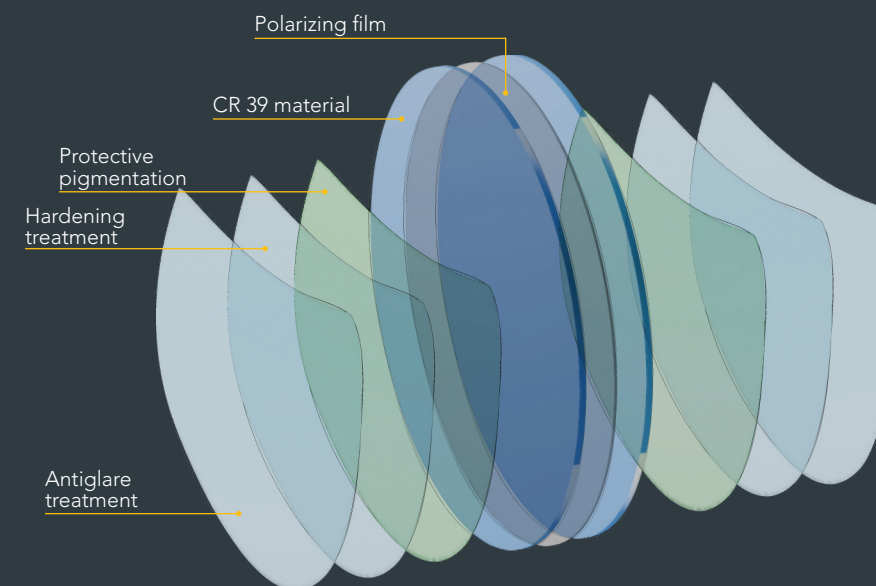

FONDA SUN LENSES WITH RETINAL INDEX®

FONDA sun lenses are designed to offer the best possible vision and the highest quality of protection for the eyes and the retina.

After years of experience in the field of Fragile Vision, where every tenth of visual acuity can determine a person's degree of autonomy, we have invested in allowing everyone to use our technology to wear high-performance sunglasses and protect their visual system and retina from potentially damaging solar radiation.

As part of our ongoing research, we have created three new lenses which, together, embody the technical, aesthetic and functional expression of our technology.

GIADA

CAT. 2 - RETINAL INDEX® 90%

Giada sunglass lens is the expression of lightness and transparency.

With internal anti-glare treatment, it offers clear vision without unwanted reflection.

Its soft green color adds a touch of elegance and luminosity to day-to-day visual experience.

EMERALDA

CAT. 2 - RETINAL INDEX® 90%

Emeralda sunglass lens offers superior transparency thanks to its double anti-glare coating, both inside and out. This makes it particularly transparent. Its brighter green not only adds an element of vivacity, but also reflects its optical excellence.

AMBRA

CAT. 3 - RETINAL INDEX® 99%

Ambra sunglass lens generates warmth and tranquillity. It has been designed to offer the greatest possible protection. Ambra has a dark golden color that reduces light and generates a relaxing effect. It has an intense polarizing effect that eliminates glare.
