CARRELLI ELEVATORI

The current generation of CTC forklifts exemplifies simplicity and efficiency in carrying out production activities across various sectors.

The synergy between the forklift and the operator is fully realized when the user feels comfortable in their work activities.

This design philosophy has led to a wide range of high-capacity forklifts, featuring innovative technologies and cutting-edge technical solutions tailored to your needs.

Our particular attention and sensitivity to safety have resulted in an ergonomic operator compartment, providing excellent visibility of the handled loads.

The entire ergonomic design is conceived to ensure a correct body posture and encompasses all operational aspects. This approach minimizes operator fatigue, thereby maintaining greater efficiency throughout the work shift.

Environment

We are deeply committed to environmental protection, which is vital for future generations. Our entire range of electric production forklifts utilizes AC technology, ensuring an optimal balance between low energy consumption and minimal polluting emissions.

Safety

The safety of our forklifts is a fundamental requirement, as is the control of the vehicle's stability.

Advantages

Our key strengths lie in the millimetric adjustments of traction speed, lifting speed, and steering.

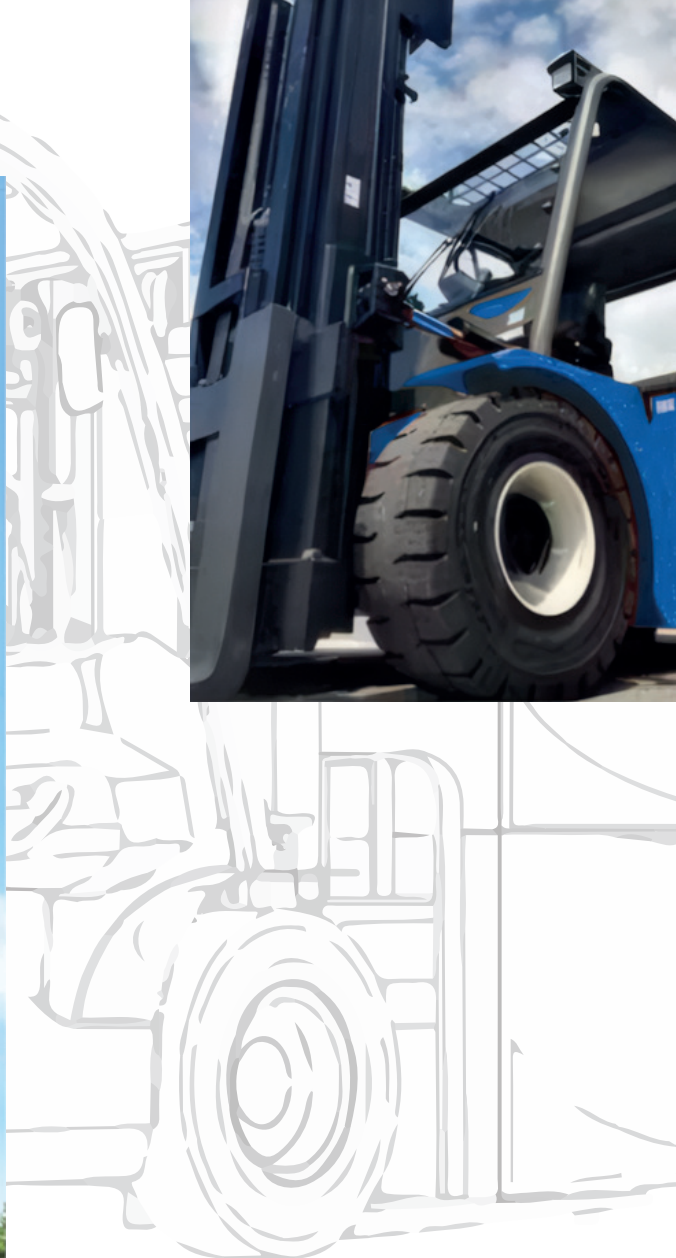

Custom Forklift Manufacturing

We design and manufacture forklifts in specialized versions, tailored for specific dimensions, performance requirements, and unique operating environments. These machines are distinguished by their specific features and characteristics.

Made in Italy

The components of our forklifts are almost entirely made in Italy. This ensures competitive costs and rapid availability of spare parts. Our maintenance service is also direct, provided by our specialized technicians or through our local partners.

The "intelligent" electric forklifts are powerful and simultaneously environmentally conscious, boasting zero emissions and maximum quietness. They maintain high performance across multiple work shifts while also ensuring lower energy and maintenance costs.

In Europe, the market trend for electric forklifts has shown a high demand for high-capacity models for years, increasingly directing logistics and goods handling towards the realm of the green economy.
